## Session 2025-2026

<b>Vision:</b> Dream of where you want.	<b>Mission:</b> Means to achieve Vision
---	---

**Program Educational Objectives of the program (PEO):** (broad statements that describe the professional and career accomplishments)

PEO1	<b>Preparation</b>	<b>P: Preparation</b>	<b>Pep-CL abbreviation pronounce as Pep-si-IL easy to recall</b>
PEO2	<b>Core Competence</b>	<b>E: Environment (Learning Environment)</b>	
PEO3	<b>Breadth</b>	<b>P: Professionalism</b>	
PEO4	<b>Professionalism</b>	<b>C: Core Competence</b>	
PEO5	<b>Learning Environment</b>	<b>L: Breadth (Learning in diverse areas)</b>	

**Program Outcomes (PO):** (statements that describe what a student should be able to do and know by the end of a program)

**Keywords of POs:**

Engineering knowledge, Problem analysis, Design/development of solutions, Conduct Investigations of Complex Problems, Engineering Tool Usage, The Engineer and The World, Ethics, Individual and Collaborative Team work, Communication, Project Management and Finance, Life-Long Learning

**PSO Keywords:** Cutting edge technologies, Research

“I am an engineer, and I know how to apply engineering knowledge to investigate, analyse and design solutions to complex problems using tools for entire world following all ethics in a collaborative way with proper management skills throughout my life.” to contribute to the development of cutting-edge technologies and Research.

**Integrity:** I will adhere to the Laboratory Code of Conduct and ethics in its entirety.

**Name and Signature of Student and Date**

(Signature and Date in Handwritten)

## Mission of the Department

To establish learning ambience for ushering in computer engineering professionals in core and multidisciplinary area by developing Problem-solving skills through emerging technologies.

Session	2025-26 (ODD)	Course Name	Operating System Lab
Semester	5	Course Code	23IOT1504
Roll No	42	Name of Student	Karan Chopkar

Practical Number	7
Course Outcome	<ol style="list-style-type: none"><li>1. <b>CO4:</b> Simulate and implement disk scheduling algorithms such as FCFS and SSTF.</li><li>2. <b>CO4:</b> Calculate and compare total head movement to evaluate the efficiency of different scheduling techniques.</li><li>3. <b>CO4:</b> Understand how effective disk scheduling enhances overall system performance and resource utilization.</li></ol>
Aim	Implement a program to simulate disk scheduling algorithms. A. FCFS B. SSTF
Problem Definition	Design and implement a program to simulate different disk scheduling algorithms that determine the order in which pending disk I/O requests are processed. The program should calculate the total head movement and display the sequence in which tracks are accessed using the FCFS and SSTF methods.
Theory (100 words)	<p>Disk scheduling algorithms are used in operating systems to decide the order of servicing I/O requests from multiple processes. When several processes request access to different tracks on the disk, the scheduling method determines how the disk head moves to fulfill these requests efficiently.</p> <p><b>Objective:</b></p> <ul style="list-style-type: none"><li>• To minimize total head movement, average seek time, and response time.</li><li>• To ensure fairness and improve the overall efficiency of disk operations.</li></ul>

	<p>1. First Come First Serve (FCFS):</p> <ul style="list-style-type: none"><li>• In FCFS, the requests are handled in the exact order they arrive. The disk head moves from one requested track to the next without reordering.</li><li>• Advantage: Simple to implement and fair to all requests.</li><li>• Disadvantage: Can result in large total head movement if requests are far apart, leading to poor performance.</li></ul> <p>2. Shortest Seek Time First (SSTF):</p> <ul style="list-style-type: none"><li>• In SSTF, the request that is closest to the current head position is selected next. This reduces the overall seek time since the nearest track is always served first.</li><li>• Advantage: Minimizes total head movement and average seek time.</li><li>• Disadvantage: May lead to starvation of requests that are far from the current head position.</li></ul> <p>Applications:</p> <p>These algorithms are essential in optimizing disk performance, improving throughput, and reducing latency in systems where multiple processes compete for disk access.</p>	
Procedure and Execution (100 Words)	<p>Step for Implementation:</p> <ol style="list-style-type: none"><li>1. Start the program and input the total number of requests and their track numbers.</li><li>2. Enter the initial position of the disk head.</li><li>3. Implement two functions:<ul style="list-style-type: none"><li>◦ Simulate_fcfs() for the FCFS algorithm.</li><li>◦ simulate_sstf() for the SSTF algorithm.</li></ul></li><li>4. In FCFS:<ul style="list-style-type: none"><li>◦ Service requests in the order they are received.</li><li>◦ Calculate total head movement.</li></ul></li><li>5. In SSTF:<ul style="list-style-type: none"><li>◦ Select the request closest to the current head each time.</li><li>◦ Mark served requests to avoid repetition.</li></ul></li><li>6. Display the order of head movement and the total number of tracks traversed.</li><li>7. End the program after displaying both algorithm results.</li></ol>	
	<p>Code:</p> <pre>#include &lt;stdio.h&gt;  #include &lt;stdlib.h&gt;  #include &lt;limits.h&gt;</pre>	

```
#define MAX_REQUESTS 100

void simulate_fcfs(int requests[], int num_requests,
int initial_head) {

--- FCFS Disk Scheduling Simulation ---  
Head Movement Path: 23 -> 22 -> 24 -> 20 -> 21 -> 23 -> 22 -> 23 -> 24 -> 20  
Total Head Movement (FCFS): 147 tracks  
--- SSTF Disk Scheduling Simulation ---  
Head Movement Path: 23 -> 22 -> 21 -> 22 -> 23 -> 24 -> 20 -> 21 -> 20 -> 24  
Total Head Movement (SSTF): 56 tracks  
--- Disk Scheduling Simulation ---

## Output Analysis

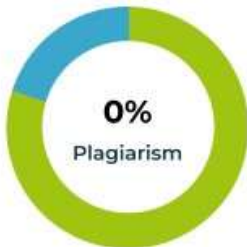

- FCFS services requests in the arrival order, resulting in higher total head movement.
- SSTF chooses the nearest track each time, significantly reducing the total seek time.

Conclusion	<p>The simulation demonstrates how different disk scheduling algorithms affect disk performance.</p> <ul style="list-style-type: none"><li>• <b>FCFS</b> is simple and fair but not efficient in minimizing head movement.</li><li>• <b>SSTF</b> improves efficiency by always selecting the closest request, leading to faster disk access.</li></ul> <p>Thus, proper selection of disk scheduling algorithms can improve system throughput and overall performance.</p>
